

Case : Daily Zettacamp

Case : 'How to install windows on Your PC'

(basic input output)

problems

→ PC without OS

- hardware
- RAM
- storage
- PSU

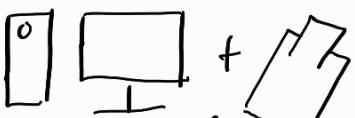

→ Can only configure hardware + BI OS

→ NO browser, no INTERNET

→ But can insert flashdisk / CD

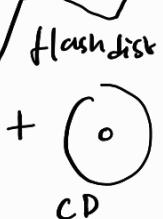

- USB/CD

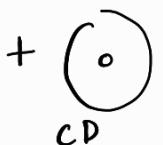

other

→ Need other computer with internet to download windows

→ write the windows OS installer file to flashdisk or CD

CD

- BIOS

→ insert flashdisk to Computer ~ then turn it on
then BIOS will recognize windows to do the installation

- Hardware
- RAM
- Storage
- PSU

→ Next → Next → Next

→ Congratulation, you have windows installed

crucial : electricity

Solving

- Hardware - check alignment

- fittings

- USB/CD

- format

- BIOS

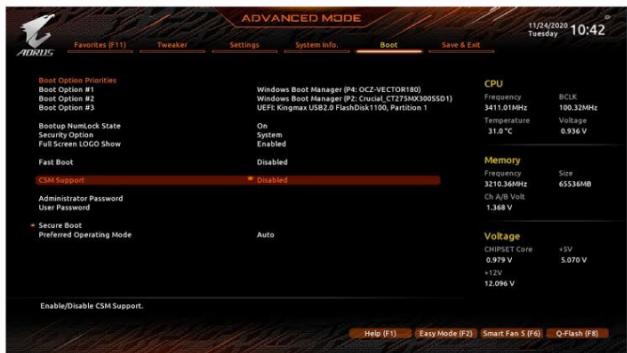

- manufacturer

• Step to reproduce

1. Check that computer to be installed can turn on

- If it can't and keep buzzing, there is a problem on RAM, check the alignment
- if the fan run fast and noisy, there is a problem with CPU fan, check the alignment
- If you cannot still go the motherboard BIOS, there is a problem with motherboard, seek answer from forum like reddit, quora or youtube. If you can't find it, contact the motherboard manufacturer.

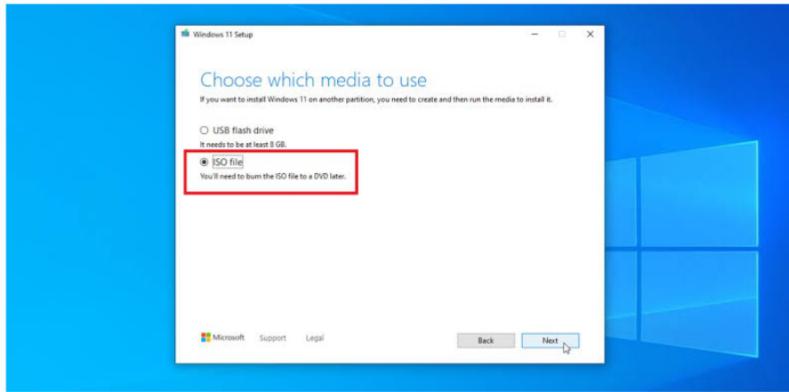

5. If you manage to get in BIOS, congrats. You have one-third task done

6. Now, download windows installer from other computer that has OS, browser, and internet

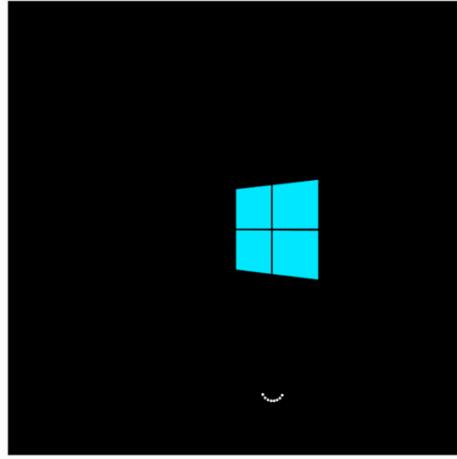

7. Write Windows installer on USB/CD drive from the executable downloaded file previously

8. If it is not successful, try to format the USB/CD first.

- Once finish, turn off the computer without OS first then insert the wrote USB with windows into this computer
- Turn on the computer with inserted USB, and the BIOS will recognize windows installation. if not, there is a problem with motherboard BIOS, Check Step 4.

11. Click next, next, and next. And eventually you will see windows menu and utility
